Foreword	xii
Preface	xiii
Contributors	xv
I Model Theory of Strong Logics	1
1 Expressive power of infinitary [0, 1]-logics	3
<i>Christopher J. Eagle</i>	
1 Introduction	4
2 Infinitary logics for metric structures	6
3 Consequences of Scott's Isomorphism Theorem	13
4 Definability in $\mathcal{L}_{\omega_1, \omega}$	16
Bibliography	21
2 Scott processes	23
<i>Paul B. Larson</i>	
1 Introduction	24
2 Formulas and projections	26
3 Scott processes	31
4 Consequences of coherence	32
5 Ranks and Scott sentences	34
6 Building countable models	40
7 Models of cardinality \aleph_1	46
8 Finite existential blocks	51
9 Extending a process of limit length	53
10 Absoluteness	60
11 A local condition for amalgamation	64
12 Isomorphic subprocesses	68
13 Projection structures	71
Bibliography	75

3 Failure of 0-1 law for sparse random graph in strong logics (Sh1062)	77
<i>Saharon Shelah</i>	
0 Introduction	78
1 On the logic $L_{\infty, k}$	86
2 The LFP Logic	91
3 Revisiting induction	96
Bibliography	101
II Model Theory of Special Classes of Structures 103	
4 Maximality of continuous logic	105
<i>Xavier Caicedo</i>	
1 Introduction	106
2 Preliminaries	107
3 Characterizing equivalence	113
4 General $[0, 1]$ -valued logics	117
5 Compact extensions and approximations	120
6 Lindström's theorem	124
7 Comments	128
8 Acknowledgments	128
Bibliography	129
5 Model theory and metric convergence I: Metastability and dominated convergence	131
<i>Eduardo Dueñez and José Iovino</i>	
1 A finitary formulation of convergence	135
2 Convergence of nets in metric structures and uniform metastability	140
3 Loeb structures	144
4 Integration structures	149
5 Directed integration structures	152
6 Background on metric model theory	155
Bibliography	185
6 Randomizations of scattered sentences	189
<i>H. Jerome Keisler</i>	
1 Introduction	190
2 Scattered sentences	191
3 Randomizations of theories	193
4 Basic randomizations	196
5 Events defined by infinitary formulas	199
6 Countable generators of randomizations	202

7	A representation theorem	206
8	Elementary embeddability in a basic randomization	208
9	Sentences with few separable randomizations	212
10	Few separable randomizations versus scattered	215
11	Some open questions	218
	Bibliography	219
7	Existentially closed locally finite groups (Sh312)	221
	<i>Saharon Shelah</i>	
0	Introduction	222
1	Definable types	233
2	There are enough reasonable schemes	248
3	Symmetrizing	265
4	For fixing a distinguished subgroup	272
5	Constructing complete existentially closed G	280
6	Other classes	294
	Bibliography	297
8	Analytic Zariski structures and non-elementary categoricity	299
	<i>Boris Zilber</i>	
1	Analytic L -Zariski structures	301
2	Model theory of analytic Zariski structures	306
3	Some examples	317
	Bibliography	323
	III Abstract Elementary Classes	325
9	Hanf numbers and presentation theorems in AECs	327
	<i>John T. Baldwin and Will Boney</i>	
1	Introduction	328
2	Semantic arguments	331
3	Syntactic approaches	333
4	The Big Gap	344
	Bibliography	349
10	A survey on tame abstract elementary classes	353
	<i>Will Boney and Sébastien Vasey</i>	
1	Introduction	354
2	A primer in abstract elementary classes without tameness	359
3	Tameness: what and where	373
4	Categoricity transfer in universal classes: an overview	384
5	Independence, stability, and categoricity in tame AECs	391
