About the companion website	xiv
<b>1 Crossover design – definitions, notes, and limitations</b>	<b>1</b>
1.1 Unsuitability for acute or most infectious diseases	2
1.2 Inappropriateness for treatments with long-lasting effects	2
1.3 Loss of efficiency in the presence of carry-over effects	3
1.4 Concerns of treatment-by-period interaction	3
1.5 Flaw of the commonly used two-stage test procedure	4
1.6 Higher risk of dropping out or being lost to follow-up	4
1.7 More assumptions needed in use of a crossover design	5
1.8 General principle and conditional approach used in the book	5
<b>2 AB/BA design in continuous data</b>	<b>7</b>
2.1 Testing non-equality of treatments	10
2.2 Testing non-inferiority of an experimental treatment to an active control treatment	11
2.3 Testing equivalence between an experimental treatment and an active control treatment	12
2.4 Interval estimation of the mean difference	13
2.5 Sample size determination	16
2.5.1 Sample size for testing non-equality	16
2.5.2 Sample size for testing non-inferiority	17
2.5.3 Sample size for testing equivalence	18
2.6 Hypothesis testing and estimation for the period effect	19
2.7 Estimation of the relative treatment effect in the presence of differential carry-over effects	21
2.8 Examples of SAS programs and results	22
Exercises	27

<b>3 AB/BA design in dichotomous data</b>	<b>30</b>
3.1 Testing non-equality of treatments	34
3.2 Testing non-inferiority of an experimental treatment to an active control treatment	36
3.3 Testing equivalence between an experimental treatment and an active control treatment	39
3.4 Interval estimation of the odds ratio	40
3.5 Sample size determination	42
3.5.1 Sample size for testing non-equality	42
3.5.2 Sample size for testing non-inferiority	42
3.5.3 Sample size for testing equivalence	43
3.6 Hypothesis testing and estimation for the period effect	45
3.7 Testing and estimation for carry-over effects	47
3.8 SAS program codes and likelihood-based approach	48
Exercises	51
<b>4 AB/BA design in ordinal data</b>	<b>57</b>
4.1 Testing non-equality of treatments	62
4.2 Testing non-inferiority of an experimental treatment to an active control treatment	64
4.3 Testing equivalence between an experimental treatment and an active control treatment	65
4.4 Interval estimation of the generalized odds ratio	66
4.5 Sample size determination	67
4.5.1 Sample size for testing non-equality	67
4.5.2 Sample size for testing non-inferiority	68
4.5.3 Sample size for testing equivalence	68
4.6 Hypothesis testing and estimation for the period effect	70
4.7 SAS codes for the proportional odds model with normal random effects	72
Exercises	74
<b>5 AB/BA design in frequency data</b>	<b>75</b>
5.1 Testing non-equality of treatments	78
5.2 Testing non-inferiority of an experimental treatment to an active control treatment	81
5.3 Testing equivalence between an experimental treatment and an active control treatment	83
5.4 Interval estimation of the ratio of mean frequencies	84
5.5 Sample size determination	86
5.5.1 Sample size for testing non-equality	86
5.5.2 Sample size for testing non-inferiority	87
5.5.3 Sample size for testing equivalence	88
5.6 Hypothesis testing and estimation for the period effect	88

5.7 Estimation of the relative treatment effect in the presence of differential carry-over effects	90
Exercises	92
<b>6 Three-treatment three-period crossover design in continuous data</b>	<b>95</b>
6.1 Testing non-equality between treatments and placebo	102
6.2 Testing non-inferiority of an experimental treatment to an active control treatment	103
6.3 Testing equivalence between an experimental treatment and an active control treatment	104
6.4 Interval estimation of the mean difference	104
6.5 Hypothesis testing and estimation for period effects	105
6.6 Procedures for testing treatment-by-period interactions	107
6.7 SAS program codes and results for constant variance	109
Exercises	111
<b>7 Three-treatment three-period crossover design in dichotomous data</b>	<b>115</b>
7.1 Testing non-equality of treatments	121
7.1.1 Asymptotic test procedures	121
7.1.2 Exact test procedures	123
7.1.3 Procedures for simultaneously testing non-equality of two experimental treatments versus a placebo	124
7.2 Testing non-inferiority of an experimental treatment to an active control treatment	126
7.3 Testing equivalence between an experimental treatment and an active control treatment	127
7.4 Interval estimation of the odds ratio	129
7.5 Hypothesis testing and estimation for period effects	131
7.6 Procedures for testing treatment-by-period interactions	133
7.7 SAS program codes and results for a logistic regression model with normal random effects	136
Exercises	138
<b>8 Three-treatment three-period crossover design in ordinal data</b>	<b>141</b>
8.1 Testing non-equality of treatments	150
8.1.1 Asymptotic test procedures	150
8.1.2 Exact test procedure	152
8.2 Testing non-inferiority of an experimental treatment to an active control treatment	153
8.3 Testing equivalence between an experimental treatment and an active control treatment	153
8.4 Interval estimation of the GOR	154
8.5 Hypothesis testing and estimation for period effects	156

8.6	Procedures for testing treatment-by-period interactions	159
8.7	SAS program codes and results for the proportional odds model with normal random effects	160
	Exercises	162
<b>9</b>	<b>Three-treatment three-period crossover design in frequency data</b>	<b>164</b>
9.1	Testing non-equality between treatments and placebo	170
9.2	Testing non-inferiority of an experimental treatment to an active control treatment	173
9.3	Testing equivalence between an experimental treatment and an active control treatment	174
9.4	Interval estimation of the ratio of mean frequencies	175
9.5	Hypothesis testing and estimation for period effects	178
9.6	Procedures for testing treatment-by-period interactions	179
	Exercises	181
<b>10</b>	<b>Three-treatment (incomplete block) crossover design in continuous and dichotomous data</b>	<b>183</b>
10.1	Continuous data	185
10.1.1	Testing non-equality of treatments	188
10.1.2	Testing non-equality between experimental treatments (or non-nullity of dose effects)	189
10.1.3	Interval estimation of the mean difference	190
10.1.4	SAS codes for fixed effects and mixed effects models	192
10.2	Dichotomous data	194
10.2.1	Testing non-equality of treatments	197
10.2.2	Testing non-equality between experimental treatments (or non-nullity of dose effects)	199
10.2.3	Testing non-inferiority of either experimental treatment to an active control treatment	199
10.2.4	Interval estimation of the odds ratio	200
10.2.5	SAS codes for the likelihood-based approach	202
	Exercises	203
